Smart Card Management System with Entrust PKI Integration

Overview

With Qsignon™ Management Console (QMC) you can easily manage your users. You can register, distribute and manage your smart cards, assign a two-factor authentication device quickly and easily, distribute and enroll smart cards throughout the enterprise using a centralized administration system, and manage existing PKIs, and disk encryption data.

As your end users can perform tasks such as card information backups and password resets using a web interface for "self-service," you will reduce the cost of IT support substantially and increase productivity.

You can also enforce policy-based access controls, assist in managing PKI credentials, and provide customizable role authorization policies. You will be able to effectively manage the complete lifecycle of strong authentication devices.
